Cell Biology Vocabulary

Photosynthesis: The process by which plants use sunlight, water, and carbon dioxide to make glucose and oxygen.

• Osmosis - The diffusion of water across a selectively permeable membrane.

• Diffusion – The movement of particles from high concentration to low concentration.

Mitochondria — The organelle that releases energy from food through cellular respiration.

Example: Muscle cells contain many mitochondria.

Ribosome: The site of protein synthesis in the cell.

Osmosis - The diffusion of water across a selectively permeable membrane.

Genetics Table

Term	Definition
Allele	A different form of the same gene.
Genotype	The genetic makeup of an organism, including both dominant and recessive alleles.
Phenotype	The observable traits of an organism.

Natural selection refers to the process by which organisms better adapted to their environment survive and reproduce more often.

Glossary

Homeostasis
The maintenance of stable internal conditions in an organism.
Enzyme
A protein that speeds up chemical reactions in living things.

Key terms: cytoplasm, vacuole

The cytoplasm is a jelly-like substance that fills the cell.
